

## ON QUASI-FROBENIUSEAN AND ARTINIAN RINGS

Roger Yue Chi Ming

**Abstract.** Left  $p$ -injective rings, which extend left self injective rings, have been considered in several papers (cf. for example, [10] – [14]). The following generalizations of left  $p$ -injective rings are here introduced: (1)  $A$  is called a left min-injective ring if, for any minimal left ideal  $U$  of  $A$  (if it exists), any left  $A$ -homomorphism  $g : U \rightarrow A$ , there exists  $y \in A$  such that  $g(b) = by$  for all  $b \in U$ ; (2)  $A$  is left  $np$ -injective if, for any non-nilpotent element  $c$  of  $A$ , any left  $A$ -homomorphism  $g : Ac \rightarrow A$ , there exists  $y \in A$  such that  $g(ac) = acy$  for all  $a \in A$ . New characteristic properties of quasi-Frobeniusean rings are given. It is proved that  $A$  is quasi-Frobeniusean iff  $A$  is a left Artinian, left and right min-injective ring. If  $A$  is left  $np$ -injective, then (a) every left or right  $A$ -module is divisible and (b) any reduced principal left ideal of  $A$  is generated by an idempotent. Further properties of left  $CM$ -rings (introduced in [14]) are developed. The following nice result is established : If  $U$  is a minimal left ideal of a left  $CM$ -ring  $A$ , the following are then equivalent: (a)  ${}_A U$  is injective; (b)  ${}_A U$  is projective; (c)  ${}_A U$  is  $p$ -injective. Consequently,  $A$  is semi-simple Artinian iff  $A$  is a left  $CM$ -ring with finitely generated projective essential left socle. Division rings are also characterised. Known results are improved.

**Introduction.** This note contains new characteristic properties of quasi-Frobeniusean rings in terms of min-injective rings (defined below). It is proved that  $A$  is quasi-Frobeniusean in  $A$  is a left Artinian, left and right min-injective ring. Left  $CM$ -rings (introduced in [14]) are further studied. In particular, it is proved that if  $U$  is a minimal left ideal of a left  $CM$ -ring  $A$ , then  ${}_A U$  is injective iff it is projective iff it is  $p$ -injective. Certain results on  $CM$ -rings (14) are improved. A generalization of left  $p$ -injective rings, called  $np$ -injective rings, is also considered and various properties are derived. Characteristic properties of division rings and semi-simple Artinian rings are given.

Throughout,  $A$  refers to an associative ring with identity and  $A$ -modules are unitary.  $Z, J, S$  will denote respectively the left singular ideal, the Jacobson radical and the left socle of  $A$ .  $A$  is called left non-singular (resp. semi-simple) iff  $Z = 0$  (resp.  $J = 0$ ). Recall that a left  $A$ -module  $M$  is  $p$ -injective (resp.  $f$ -injective) iff for any principal (resp. finitely generated) left ideal  $I$  of  $A$ , any left  $A$ -homomorphism  $g : I \rightarrow M$ , there exists  $y \in M$  such that  $g(b) = by$  for all  $b \in I$ . Then  $A$  is

*AMS Subject Classification* (1980): 16A30, 16A35, 16A36, 16A40, 16A52.

*Key words and phrases:* quasi-Frobeniusean, Artinian, von Neumann regular, min-injective,  $np$ -injective,  $CM$ -ring.

von Neumann regular iff every left  $A$ -module is  $p$ -injective ( $f$ -injective). It is well-known that  $A$  is regular iff every left  $A$ -module is flat. If  $I$  is a  $p$ -injective left ideal of  $A$ , then  $A/I$  is a flat left  $A$ -module.

As usual, a left (right) ideal of  $A$  is called reduced iff it contains no non-zero nilpotent element. An ideal of  $A$  will always mean a two-sided ideal. In [14], the following generalization of semi-simple Artinian, left uniform and left duo rings is introduced:  $A$  is called a left  $CM$ -ring iff, for any maximal essential left ideal  $M$  of  $A$  (if it exists), every complement left subideal is an ideal of  $M$ . Left  $CM$ -rings also extend left  $PCI$ -rings [4] and the domains constructed by Cozzens [3]. Regular left  $CM$ -rings are left and right  $V$ -rings but left  $CM$ , left or right  $V$ -rings need not be regular. Recall that (1)  $A$  is left pseudo-coherent iff  $l(F)$  is a finitely generated left ideal for any finitely generated right ideal  $F$  of  $A$ ; (2)  $A$  is  $ELT$  (resp.  $MELT$ ) iff every essential (resp. maximal essential, if it exists) left ideal is an ideal of  $A$ . Rings whose ideals are left annihilators are called  $TLA$ -rings. We know that if  $A$  is a semi-prime  $TLA$ -ring, then every ideal of  $A$  is generated by a central idempotent and hence  $A$  is a biregular, fully left and right idempotent ring. Note that semi-prime rings whose left ideals are left annihilators must be semi-simple Artinian. It is well-known that in a quasi-Frobeniusean ring, every one-sided ideal is an annihilator.

H. Tominaga (Math. Reviews 81i#16014) pointed out that [12, Theorem 8] depended on an unproved result of R. P. Kurshan [8, Proposition 3.4] (cf. [6]). By going through the proof of [8, Theorem 3.3 and Proposition 3.4] (keeping in view Ginn's remark [6, p. 105]), [12, Lemma 5] yields.

LEMMA 1. *Let  $A$  be a  $TLA$ -ring whose essential left ideals are left annihilators satisfying the maximum condition on ideals and essential left ideals such that  $l(Z)$  is a finitely generated left ideal and  $A/Z$  is semi-simple Artinian. Then  $A$  is left Artinian.*

Applying [14, Proposition 2.8], [2, p. 69]) and Lemma 1, we get

COROLLARY 1.1. *The following conditions are equivalent for an  $ELT$ ,  $TLA$ -ring satisfying the maximum condition on left annihilators: (1)  $A$  is left Artinian; (2) Both  $A$  and  $A/Z$  have left finite Goldie dimension; (3)  $A/Z$  is left or right self-injective and  $l(Z)$  is a finitely generated left ideal; (4)  ${}_A Z$  is finitely generated.*

We now introduce the following generalization of left  $p$ -injective and semi-prime rings.

*Definition.*  $A$  is called a left min-injective ring if, for any minimal left ideal  $U$  of  $A$  (if it exists), any left  $A$ -homomorphism  $g : U \rightarrow A$ , there exists  $y \in A$  such that  $g(b) = by$  for all  $b \in U$ .

[12, Theorem 8(iii)] is proved in the next result (this extends a result of C. Faith [5, p. 209]).

THEOREM 2. *The following conditions are equivalent:*

- (1)  $A$  is quasi-Frobeniusean;

- (2)  $A$  is a right  $p$ -injective, left min-injective, left pseudocoherent TLA-ring with maximum condition on right annihilators;
- (3)  $A$  is a left Noetherian, left  $p$ -injective, right min-injective ring;
- (4)  $A$  is a left Artinian, left and right min-injective ring;
- (5)  $A$  is a right  $f$  injective ring with maximum condition on left annihilators.

*Proof.* Obviously, (1) implies (2) and (3).

Assume (2). If  $I$  is an ideal of  $A$ ,  $T = l(B)$  for some right ideal  $B$  of  $A$ . Since  $A$  satisfies the maximum condition on right annihilators, then  $T = l(F)$ , where  $F$  is a finitely generated right subideal of  $B$  and since  $A$  is left pseudo-coherent,  $AT$  is finitely generated. In particular,  ${}_A J$  is finitely generated. Since  $A$  is right  $p$ -injective with minimum condition on left annihilators, then  $A$  is right perfect by a theorem of M. Ikeda – T. Nakayama which yields that  $A$  is left Artinian [2, p. 69]. Thus (2) implies (4).

Assume (3). Since  $A$  is left  $p$ -injective with the minimum condition on right annihilators, then  $A$  is left perfect which, together with  $A$  left Noetherian, implies  $A$  left Artinian. Therefore (3) implies (4).

Assume (4). Let  $U$  be a minimal left ideal of  $A$ ,  $0 \neq u \in U$ . Since  $A$  is both left and right perfect,  $uA$  contains a minimal right ideal  $V = vA$ ,  $v \in A$ . Then  $l(u) \subseteq l(v)$  and if  $f : Au \rightarrow Av$  is the left  $A$ -homomorphism defined by  $f(au) = av$  for all  $a \in A$ , since  $U = Au$  is a minimal left ideal, then  $f$  is an isomorphism and if  $g : Av \rightarrow Au$  is the inverse isomorphism,  $i : Au \rightarrow A$  the natural injection, then there exists  $w \in A$  such that  $u = ig(v) = vw$ . Therefore  $uA = vA$  is a minimal right ideal and if  $0 \neq b \in l(r(u))$ , then  $r(u) = r(l(r(u))) \subseteq r(b)$  and if  $h : uA \rightarrow bA$  is the right  $A$ -homomorphism defined by  $h(ua) = ba$  for all  $a \in A$ ,  $j : bA \rightarrow A$  the natural injection, then there exists  $c \in A$  such that  $b = jh(u) = cu \in Au$ . Thus  $l(r(Au)) = l(r(u)) = Au = U$ . Similarly, any minimal right ideal of  $A$  is a right annihilator and by [9, Proposition 1], (4) implies (5).

Assume (5). Then  $A$  is a left Noetherian ring whose left ideals are left annihilators (cf. [12, p. 134]). Since  $A/J$  is a semi-prime ring whose left ideals are left annihilators, then  $A/J$  is semi-simple Artinian (this is the crucial property mentioned by Ginn [6]). By [12, Lemma 5] and Lemma 1,  $A$  is left Artinian (indeed, the proof of [12, Lemma 5] shows that  $Z = J = l(S)$  and  $S = l(Z)$  is an essential left ideal). Since  $A$  satisfies the maximum condition on right annihilators, then (5) implies (1) by [2, Theorem 4.1].

In general, for an arbitrary ring  $A$ , a simple projective left  $A$ -module needs not be injective. However, we prove

**PROPOSITION 3.** *Let  $A$  be a left CM-ring. Then any simple projective left  $A$ -module is injective.*

*Proof.* Let  $W$  be a simple projective left  $A$ -module. Then  $W \approx A/K$ , where  $K$  is a maximal left ideal of  $A$  and since  ${}_A A/K$  is projective, then  $A = K \oplus U$ , where  $U = Ae$ ,  $e = e^2 \in A$ , is a minimal left ideal of  $A$ . If  $L$  is a proper essential left ideal of  $A$ ,  $f : L \rightarrow U$  a non-zero left  $A$ -homomorphism, then  $L/N \approx U$ , where

$N = \ker f$  is a maximal left subideal of  $L$ . Now  $L = N \oplus V$ , where  $V (\approx U)$  is a minimal left ideal of  $A$ . If  $g : V \rightarrow U$  is an isomorphism, then  $g(v) = e$  for some non-zero  $v \in V$  and  $V = Av$ . Since  $g(ev) = eg(v) = e^2 = e$ , then  $ev = v$ . If  $U \cap V \neq 0$ , then  $U = V$ . If  $U \cap V = 0$ , let  $I$  be a complement left ideal such that  $E = (U \oplus V) \oplus I$  is an essential left ideal of  $A$ . If  $E \neq A$ , since  $E$  is contained in some maximal (essential) left ideal and  $A$  is left  $CM$ ,  $v = ev \in U \cap V = 0$ , which is a contradiction. Therefore  $E = A$  and  $V = Aw$ ,  $w = w^2 \in A$  in any case. If  $M$  is a maximal left ideal containing  $L$ , by Zorn's Lemma, there exists a maximal left subideal  $C$  of  $M$  containing  $N$  with  $C \cap V = 0$ . Then  $C$  is a complement left subideal of  $M$  which implies  $CM \subseteq C$ , whence  $NV \subseteq CM \cap V \subseteq C \cap V = 0$ . Now for any  $y \in L$ ,  $y = d + aw$ ,  $d \in N$ ,  $a \in A$  and since  $dw \in NV = 0$ ;  $f(y) = f(aw) = f(dw) + f(aw) = (d + aw) f(w) = yf(w)$  which proves that  ${}_A U$  is injective, whence  $A_W$  is injective.

Since a finitely generated  $p$ -injective left ideal of  $A$  is a direct summand of  ${}_A A$ , the next corollary then follows.

**COROLLARY 3.1.** *The following conditions are equivalent for any minimal left ideal  $U$  of a left  $CM$  ring  $A$ : (a)  ${}_A U$  is projective; (b)  ${}_A U$  is injective; (c)  ${}_A U$  is  $p$ -injective.*

Applying [14, Remark 5(2)], we get

**COROLLARY 3.2.** *If  $A$  is a MELT, left  $CM$ -ring, then a simple left  $A$ -module is injective iff it is  $p$ -injective.*

**COROLLARY 3.3.** *If  $A$  is left  $CM$ , left Noetherian, then  ${}_A S$  is injective iff it is projective.*

**COROLLARY 3.4.** *If  $A$  is a left  $CM$  ring with  ${}_A S$  finitely generated projective, then  $A$  is the ring direct sum of a semisimple Artinian ring and a ring with zero socle.*

*Remark 1.* A left  $CM$ -ring with projective left socle is left min-injective.

Left  $CM$ -rings lead us to consider the following class of rings:  $A$  is called a left  $CAM$ -ring if, for any maximal essential left ideal  $M$  of  $A$  (if it exists), for any left subideal  $I$  of  $M$  which is either a complement left subideal of  $M$  or a left annihilator ideal in  $A$ ,  $I$  is an ideal of  $M$ .

Left  $CAM$ -rings generalize semi-simple Artinian, left duo, left  $PCI$ -rings and left Ore domains. Note that left  $CAM$  (left and right)  $V$ -rings need not be regular.

**PROPOSITION 4.** *If  $A$  is a semi prime left  $CAM$ -ring, then  $A$  is either semi-simple Artinian or reduced.*

*Proof.* Suppose there exists  $0 \neq z \in Z$  such that  $z^2 = 0$ . Let  $M$  be a maximal left ideal of  $A$  containing  $l(z)$ . Then  $l(z)M \subseteq l(z)$  implies  $(Mz)^2 \leq (Az)Mz \leq l(z)Mz = 0$ , whence  $M = l(z)$ . Therefore  $Az (\approx A/M)$  is a minimal left ideal which is a direct summand of  ${}_A A$  contradicting the fact that  $Z$  contains no non-zero idempotent. By [11, Lemma 2.1],  $Z = 0$ . Suppose that  $A$  is not Artinian. Then there exists a maximal essential left ideal  $E$  of  $A$ .  $E$  is reduced by [14, Lemma

1.6(1)], which implies that  $A$  is reduced (being an essential extension of  ${}_A E$ ). This proves the proposition.

The next corollary improves [14, Theorem 1.9].

**COROLLARY 4.1.** *If  $A$  is a semi prime right self-injective left CAM-ring, then  $A$  is either semi-simple Artinian or left self injective strongly regular.*

**COROLLARY 4.2.** *A semi prime left CAM-ring with maximum or minimum condition on left annihilators is a left and right Goldie ring.*

The next two corollaries give sufficient conditions for rings to be regular and self injective regular with non-zero socle.

Applying [10, Theorem 1] to Propositions 3 and 4, we get

**COROLLARY 4.3.** *The following conditions are equivalent:*

- (1)  *$A$  is either semi-simple Artinian or strongly regular with non-zero socle;*
- (2)  *$A$  is a semi prime left CAM-ring containing a finitely generated  $p$ -injective maximal left ideal;*
- (3)  *$A$  is a semi-simple left CM-ring containing a finitely generated  $p$ -injective maximal left ideal.*

**COROLLARY 4.4.** *The following conditions are equivalent:*

- (1)  *$A$  is either semi-simple Artinian or left and right self injective strongly regular with non-zero socle;*
- (2)  *$A$  is a semi prime left CAM ring containing an injective maximal left ideal.*

Following [13],  $A$  is called a right  $WP$ -ring (weak  $p$ -injective) if every right ideal not isomorphic to  $A_A$  is  $p$ -injective. As usual,  $A$  is called left uniform iff every non-zero left ideal is an essential left ideal of  $A$ . Since a left uniform right semi-hereditary ring is a left Ore domain, then [13, Lemma 1.1] yields the next remark.

*Remark 2.* The following conditions are equivalent:

- (1)  $A$  is either simple Artinian or a left Ore right principal ideal domain;
- (2)  $A$  is a prime left  $CM$ , right  $WP$ -ring.

*Remark 3.* If  $A$  is a left  $CAM$ , right  $WP$ -ring, then  $A$  is either semi-simple Artinian or strongly regular or a right principal ideal domain. (cf. [13, Corollary 1.6].)

*Remark 4.* If  $A$  is a left  $CAM$ -ring whose essential left ideals are idempotent, then  $A$  is fully left and right idempotent.

We now consider another generalization of left  $p$ -injective rings: Call  $A$  a left  $np$ -injective ring if, for any non-nilpotent element  $c$  of  $A$ , any left  $A$ -homomorphism  $g : Ac \rightarrow A$ , there exists  $b \in A$  such  $g(ac) = acb$  for all  $a \in A$ . Following [5], an element  $a$  of  $A$  is called left regular iff  $l(a) = 0$ . [10, Theorem 1] is improved in the next proposition.

PROPOSITION 5. *Let  $A$  be a left  $np$ -injective ring. Then*

- (1) *Any left regular element of  $A$  is right invertible;*
- (2)  *$Z \subseteq J$ ;*
- (3) *Every left or right  $A$ -module is divisible;*
- (4) *If  $P$  is a reduced principal left ideal of  $A$ , then  $P = Ae$ , where  $e = e^2 \in A$  and  $A(1 - e)$  is an ideal of  $A$ .*

*Proof.* (1) Let  $c \in A$  such that  $l(c) = 0$ . For any  $u \in A = r(l(c))$ ,  $l(c) = l(r(l(c))) \subseteq l(u)$  and if  $g : Ac \rightarrow A$  is the left  $A$ -homomorphism defined by  $g(ac) = au$  for all  $a \in A$ , since  $A$  is left  $np$ -injective, there exists  $b \in A$  such that  $u = g(c) = cb \in cA$ . Therefore  $A = cA$  which proves (1).

(2) If  $z \in Z$ ,  $a \in A$ , then  $l(1 - za) = 0$  implies  $(1 - za)u = 1$  for some  $u \in A$  by (1). This proves that  $z \in J$ .

(3) If  $c$  is a non-zero-divisor in  $A$ , then  $cd = 1$  for some  $d \in A$  by (1). Now  $r(c) = 0$  implies  $dc = 1$  and for any right  $A$ -module  $M$ ,  $M = Mdc \subseteq Mc \subseteq M$  implies  $M = Mc$ . Similarly, any left  $A$ -module is divisible.

(4) Let  $P = Ab$ ,  $b \in A$ , be a non-zero reduced principal left ideal. Then  $r(b) \subseteq l(b) = l(b^2)$  and the proof of (1) shows that  $r(l(bA)) = bA$  which yields  $bA = r(l(b^2)) = r(l(b^2A)) = b^2A$  (since  $b^2$  is non-nilpotent). Therefore  $b = b^2c$ ,  $c \in A$ , which implies  $b = bcb$  ( $P$  being reduced), whence  $P$  is generated by the idempotent  $e = cb$ . Also, for any  $a \in A$ ,  $(ae - eae)^2 = 0$  implies  $ae = eae$ , whence  $(1 - e)Ae = 0$ . Therefore  $(1 - e)A \subseteq A(1 - e)$  which establishes the last part of (4).

Remark 5. [1, Theorem 12] holds for right  $np$ -injective rings whose complement right ideals are finitely generated.

We now characterize division rings in terms of the following:  $A$  is called a right  $F$ -ring if, for any maximal right ideal  $M$  of  $A$ , any  $b \in M$ ,  $A/bM_A$  is flat.

THEOREM 6. *The following conditions are equivalent for a semi prime left uniform ring  $A$ :*

- (1)  *$A$  is a division ring;*
- (2)  *$A$  is a left self injective left  $F$  ring;*
- (3)  *$A$  is a left  $np$ -injective left  $F$  ring;*
- (4)  *$A$  is a right  $F$  ring.*

*Proof.* It is evident that (1) implies (2), which, in turn, implies (3).

Assume (3). If  $b \in A$ ,  $b \notin Z$ , then  $l(b) = 0$  which implies  $bc = 1$  for some  $c \in A$  (Proposition 5(1)). This shows that every maximal right ideal of  $A$  is contained in  $Z$ , whence  $A$  is a local ring with  $Z = J$  as the unique maximal right ideal (which is also the only maximal left ideal). Suppose that  $Z \neq 0$ . Since  $A$  is semi-prime, for any  $0 \neq z \in J$ ,  $Jz \neq 0$ . If  $y \in J$  such that  $yz \neq 0$ , since  ${}_A A/Jz$  is flat,  $yz = yz wz$  for some  $w \in J$ . Since  $(1 - wz)u = 1$  for some  $u \in A$ , then  $yz(1 - wz) = 0$  implies  $yz = 0$ , a contradiction. Thus  $Z = J = 0$  which proves that  $A$  is a division ring and (3) implies (4).

Assume (4). If  $u \in A$ ,  $u \neq Z$ , then  $l(u) = 0$ . Suppose that  $uA \neq A$ . If  $R$  is a maximal right ideal containing  $uA$ , since  $A/uR_A$  is flat,  $u^2 = uvu^2$  for some  $v \in R$ . Then  $(1 - uv)uz = 0$  implies  $uv = 1$ , which contradicts  $uA \neq A$ . This proves that  $A$  is a local ring with  $Z = J$  the only maximal right (and left) ideal of  $A$ . The proof of “(3) implies (4)” then shows that  $J = 0$  which proves that (4) implies (1).

**COROLLARY 6.1.** *A is simple Artinian iff A is a prime left CM, right F ring.*

*Remark 6.* A left Noetherian ring is left Artinian iff each of its prime factor rings is a left CM, right F-ring.

[7, Corollary 1.18], [10, Theorem 1], [11, Theorem 1.4], Propositions 4 and 5 yield the next result. (cf. [14, Theorem 2.2 and Proposition 2.4].)

**THEOREM 7.** *The following conditions are equivalent:*

- (1) *A is either semi-simple Artinian or strongly regular;*
- (2) *A is a semi prime left CAM-ring whose simple right modules are flat;*
- (3) *A is a semi-prime left np-injective, left CAM ring.*

Note that a ring with finitely generated projective essential left socle need not be semi-prime. We conclude with a few characteristic properties of semi-simple Artinian rings.

**THEOREM 8.** *it The following conditions are equivalent:*

- (1) *A is semi-simple Artinian;*
- (2) *A is a semi-prime TLA, left CM-ring containing a finitely generated p-injective maximal left ideal;*
- (3) *A is a left CM, left Noetherian ring with projective essential left socle;*
- (4) *A is a left CM-ring with finitely generated projective essential left socle;*
- (5) *A is a semi prime left np-injective, left or right Goldie ring.*

*Proof.* Apply Propositions 3 and 4, Corollary 4.4 and Proposition 5.
